CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDKI T1 (W03422) and MDKI T2 (W03423), of the novel mouse developmental kinase 1 (MDKI) (see als W03423), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from CDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDKI, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal signal transduction.

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDK1 T1 (W03422) and MDK1 T2 (W03423), of the novel mouse developmental kinase 1 (MDK1) (see als W03423), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; T32962.

New mouse development kinase 1 gene - use new mouse development of abnormalities
                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-NOV-1996 (first entry)

Mouse developmental kinase 1 (MDKI) (W03421) is a new member of the ceck/eph family of receptor tyrosine kinases (RTKs). Its amino cack sequence was deduced from a cDNA clone (T32960) isolated from mouse embryo and adult brain libraries. The distinct patterns of MDKI expression during mouse development suggest an important role for MDKI in the formation of neuronal structures. MDKI may be obtd. by expression in host cells. It can be used in methods for the diagnosis of diseases characterised by abnormality in a signal transduction pathway, such as neuroproliferative or neurodegenerative disorders or cancer, to screen for (ant)agonists, and to raise antibodies.

4 Novel human EPH-11ke receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal brain cDNA library. HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-1ike receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-1ike receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-PSDB; T32960.

                                                                                                                                                                                                                    Claim 11; Page 71-75; 129pp; English.

A cDNA clone encoding a novel variant of EPH-related PTK Cek5+ (290657), was isolated from a chick embryo library lambda gtl1. Cek5+ protein (R75709) contains a 16-amino insertion in the juxtamembrane domain, and be a result of alternative splicing. Cek5+ is exclusively expressed in sequence 1011 AA;

TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS
RESTRICTED TO PROSOMERES I AND 2 IN THE DIENCEPHALON AND ALL THE
REOMBOMERES IN THE HINDBRAIN DURING SEGMENTATION STAGES, LATER ON,
A SUPERIMPOSED PATTERN APPEARS THAT CORRELATES WITH THE FORMATION
OF SEVERAL AXONAL TRACTS. IN THE SOMITIC MESODERM, THE EXPRESSION
CORRELATES WITH SEGMENTATION AND THE GUIDANCE OF BOTH NEURAL CREST
AND MOTOR AXONS THROUGH THE SCLEROTOMES.

EXPRESSED AT HIGHER LEVELS IN THE ANTERIOR AND DORSAL REGIONS OF EMBRYONIC STACES 16, 24 AND 37. IN ADULT IT APPEARS TO BE UBIQUITOUSLY EXPRESSED WITH HIGHER EXPRESSION IN BRAIN AND OVARY. EXPRESSION I THE BRAIN, BRACHIAL ARCHES, TRIGEMILLA FACIAL GANGLION, AND THE RETINA OF SWIMMING TADPOLE STAGE OF DEVELOPMENT.
--- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
--- SIMILARITY: CONTAINS 1 IMMUNOCLOBULIN-LIKE C2-TYPE DOMAIN.
--- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

"I FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO
EPHRIN-A2, -A3, -A4 AND -A5.

"I CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSIME PHOSPHATE.

"I SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

"I SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO EPHRIN-A1, -A2, -A3, -A4 AND -A5.

CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE BHOSPHATE.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

ALTERNATIVE PRODUCTS: A NUMBER OF VARIANTS ARE PRODUCED BY ALTERNATIVE SPLICING.

SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VNLLDSKTIQGELGWISYPSHG

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: BRAIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CAT
SOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE III-LIKE DOMAIN.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
